Improving Health and Quality of Life in One-Person Households

Using IoT and Machine Learning

Masahide Nakamura

Graduate School of System Informatics

Kobe University, JAPAN

masa-n@cs.kobe-u.ac.jp

Abstract

Worldwide, there has been an increase in the number of individuals that live alone in one-person households (OPHs). Compared to those living with family, people in OPHs easily lose control of life rhythm. Given that the disturbance of life rhythm leads to chronic disease, they have a higher risk of illness. As such, there is an urgent demand for assistive technology that allows people in OPHs to enjoy healthy, high-quality lives. For decades, there has been significant research and development of smart systems to assist people at home. However, there are still limitations on the practical use of these systems in actual OPHs. More specifically, they are often too intrusive to the lifestyle of users or home objects. In addition, they are often expensive to deploy and maintain. Furthermore, these systems are unable to evaluate the quality of life rhythm. As a result, it is difficult for individual users to determine what their healthy life rhythms should be, and how to improve their current situation.

The goal of research is to develop a new smart system for OPHs that can minimize intrusiveness and cost, while also facilitating the assessment of life rhythms of individual users. The new system collects user position and environmental data inside the house in a non-intrusive way, using affordable IoT devices. From this data, the system then recognizes the daily activities of the user. Based on these activities, eventually, the system can quantitatively evaluate the user's life rhythms and provide practical advice for maintaining a healthy life.

Blockchain: A Software Engineering Perspective

Lawrence Chung

Computer Science Department

University of Texas at Dallas, USA

chung@utdallas.edu

Abstract

Blockchain is intended to help enhance the trustworthiness of data and transactions, by chaining and distributing blocks of the same data so that they may become more transparent, traceable, and immutable. With such a great potential, blockchain is increasingly being explored in many applications, especially in the presence of (potential) dis-/mis-/un-trust among organizations and individuals, well beyond its original use, namely, for bitcoin. However, an ad hoc approach to adopting blockchain may lead to not better, but worse, situations and results, and with severe disappointments. In this talk, I will describe *Fides* - a framework for systematically utilizing blockchain towards enhancing business processes with trustworthiness. Fides takes a goal-oriented, software engineering approach, in which trust-related concerns are explicitly represented as (soft)goals to be achieved, problems for achieving the goals are diagnosed, and then alternatives are explored in terms of business processes for eliminating or alleviating the problems, while at the same time achieving the goals. Finally, a selection is made among the alternatives that best utilize blockchain. In this approach, business processes are modelled, rules are formulated at the requirements level for beneficially transitioning from as-is to to-be, and transformed into smart contracts. At the end, I will describe a couple of applications of Fides, for an initial assessment of its strengths and weaknesses.

Bio

Lawrence Chung has been working in Requirements Engineering, System/Software Architecture and Systems Engineering. He was the principal author of the research monograph "[Non-Functional Requirements in Software Engineering](#)", and has been involved in developing "[RE-Tools](#)" (a multi-notational requirements tool), "[HOPE](#)" (a smartphone app project for people with difficulties), and "[Silverlining](#)" and "[IRIS](#)" (respectively a cloud computing and big data project). He has been a keynote speaker, invited lecturer, co-editor-in-chief for *International Journal of Innovative Software (IJIS)* and *International Journal of Big Data Intelligence and Applications (IJBDIA)*, editorial board member for Requirements Engineering Journal and International Journal of Networked and Distributed Computing, editor for ETRI Journal, and program co-chair for various international events. He is currently on the faculty of Computer Science at University of Texas at Dallas. He received his Ph.D. in Computer Science in 1993 from University of Toronto.
